#title The CDC25 "Start" gene of Saccharomyces cerevisiae:
sequencing of the active C-terminal fragment and
homologies with rhodopsin and cytochrome p450.

The sequence of 32 kb on the left arm of yeast chromosome Xi
reveals 14 open reading frames among which HSP104, SSA2,
SPA2, KNS1, DPS1/APS, SDC25, a new member of the
seripauperins family and a new ABC transporter homologous
to the human multidrug resistance protein.

#mote this protein is identified as the N4 isoform

The inactive form of the enzyme is composed of two regulatory

chains and two catalytic chains. Activation by cAMP produces two

active catalytic monomers and a regulatory dimer that binds four
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     736 SLMDPSRNHRAYRLTVAKLEP-PLIPFMPLLIKDMTFTHEGNKTFI 780

                                                                                         New peptide(s) modulating GDP exchange in complexes - with ras protein and derived antibodles, nucleic acid etc. esp. for diagnosis and treatment of cancer Claim 2; Page 23-24; 46pp; French.

The peptide antagonises the interaction of GDP-exchange factor (With the p21-GDP complex and thereby regulates the activity of 1 gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnosis and treatment of cancer Claim 2; Page 25-26; 46pp; French.
The peptide antagonises the interaction of GDP-exchange factor (GRF with the p21-GDP complex and thereby regulates the activity of ras gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expression and for use in diagnosis e.g. detecting (over)expression of GRF for
                                                                                                                                                                                                                                                                                                                                        (RHON ) RHONE POULENC RORER Schweighoffer F, Tocque B; WPI; 93-351724/44.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide which modulates GDP; exchange; GRF; GDP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (RHON) RHONE POULENC RORER Schweighoffer F, Tocque B; WPI; 93-351724/44.
                                                to produce antisense products and for use in diagnosis e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide(s) modulating GDP exchange in complexes - with ras protein and derived antibodies, nucleic acid etc. esp. for diagnosis and treatment of cancer Claim 2; Page 20-22; 46pp; French.

The peptide antagonises the interaction of GDP-exchange factor with the p21-GDP complex and thereby regulates the activity of gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to the coding sequence ca

The peptide antagonises the interaction of GDP-exchange factor (GRF with the p21-GDP complex and thereby regulates the activity of ras gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expression and for use in diagnosis e.g. detecting (over)expression of GRF for the contract of the canonic of th
                                                                                                                                                                    The mammalian son of sevenless gene has been found to have homology with various guanine exchange factors, suggesting a possible role in protein tyrosine kinase pathways via the Ras proteins. Mutations in the genes and consequently their products may result in specific defects or tumour formation. Antagonists to the protein/gene may used to treat conditions arising from mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding mammalian son of seven-less gene and proteins encoded by it - regulates tyrosine kinase signalling pathway ras proteins, may be used for diagnosis and therapy of genet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (FLOR-) FLOREY INST

Mouse mSOS2 (R84639) is a Ras guanine nucleotide releasing protein. The SH3 domains of Grb2 associate the the proline-rich domains of mSOS2 and mSOS1 (R84638). Synthetic peptides (R84640-48) based on these motifs can be used to screen for compounds that affect BCL-ABL mediated transformation. Such compounds have value in the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Arlinghaus R, Gis WPI; 95-302931/40. New peptide(s) modulating GDP exchange in complexes protein and derived antibodies, nucleic acid etc. es diagnosis and treatment of cancer Claim 2; Page 28-29; 46pp; French.
                                                                                                                                                                                                                                                                                                                                                                                                                              R47043
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The peptide antagonises the interaction of GDP-exchange factor (GRF) with the p21-GDP complex and thereby regulates the activity of ras gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expression and for use in diagnosis e.g. detecting (over)expression of GRF for
                 DNA encoding mammalian son of seven-less gene and proteins encoded by it - regulates tyrosine kinase signalling pathway via ras proteins, may be used for diagnosis and therapy of genetic

                                                                            Detection of agents that modify BCR-ABL mediated transformation useful in treatment of leukaemia and other malignancies Disclosure; Page 54-59; 105pp; English.

Mouse mSOS1 (R84638) is a Ras guanine nucleotide releasing protein that combines with BCR-ABL and Grb2 (R84636) to activate the Ras pathway leading to morphological transformation. The SH3 domains of Grb2 associate the the proline-rich domains of mSOS1 and mSOS2 (R84639). Synthetic peptides (R84640-48) based on these motifs can be used to screen for compounds that affect BCL-ABL mediated transformation. Such compounds have value in the treatment of chronic, acute myelogenous or acute lymphocytic leukaemia.

The mammalian son of sevenless gene has been found to have homology with various quanine exchange factors, suggesting a possible role in protein tyrosine kinase pathways via the Ras proteins. Mutations in the genes and consequently their products may result in specific defects or tumour formation. Antagonists to the protein/gene may be used to treat conditions arising from mutations.

The presence and quantities of these proteins can be detected using 2D gel electrophoresis comparison of cell lysates. The proteins can be used as biochemical markers to detect the phase of the endometrium and can be measured in body fluids, obviating the need for endometrial biopsies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Biochemical markers of human endometrium - useful for, diagnosis of hyperplasia and adenocarcinoma Disclosure; Page 19-20; 77pp; English. Proteins W54349-W54364 are examples of proteins produce endometrium during the hyperplasia, adenocarcinoma or the hyperplasia, adenocarcinoma or the hyperplasia.

The present sequence represents a MCG7 protein. The protein has gene regulatory functions, and has monology to a heat shock protein or heat shock-binding protein. The specification also describes MCG4, which is homologous to guanine nucleotide exchange factor protein, and MCG18, which is homologous to a zinc finger protein.

Detection of mutations in the MCG genes can be used to identify the propensity for various types of cancer, and to treat, arrest, or otherwise ameliorate, the effects of a cancer in an animal or bird.

The specification also describes MCG4, which is homologous to guanine nucleotide exchange factor protein, and MCG18, which is homologous to a zinc finger protein. Detection of mutations in the MCG genes can be used to identify the propensity for various types of cancer, and to treat, arrest, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23-MAY-1997; AU-006973.

The present sequence represents a human PKG-green fluorescent protein (GFP) fusion protein. The fusion protein is used in an assay to examplify the invention. The specification describes how quantitative information about the influence of a molecule on a cellular response is obtained by recording the variation, caused by the molecule on mechanically intact living cells, in the spatially distributed light emitted from a luminophore present in the cells. The variation in light camission is processed to provide information that correlates spatial distribution to the degree of the molecule. The method is used to identify agents that (in)directly affect intracellular signalling, especially to screen for potential therapeutic agents or toxins, and to identify new drug targets.

PT redistribution of luminophores - specifically fusions of green redistribution of luminophores - specifically fusions of green process of present sequence represents and potential therapeutic agents process particularly for identifying toxins and potential therapeutic agents process particularly for identifying toxins and potential therapeutic agents process agreen fluorescent protein (GFP)-human CC processed sequence represents a green fluorescent protein (GFP)-human CC processed information. The influence of a molecule on a cellular response is contained by recording the variation, caused by the molecule, on the molecule processed to provide information that correlates spatial consistion is processed to provide information that correlates spatial consistion is processed to provide information that correlates spatial constitution to the degree of the molecule. The method is used to identify agents that (in)directly affect intracellular signalling, considered in the spatial therapeutic agents or toxins, and to consist the consist of the molecule.
